

Parents guide to AI in India

AI for Indian parents: a parent guide to AI for Class 8 to 12. Built on the Humain AI Literacy Framework. Compliant with the DPDP Act 2023.

"Practical AI literacy for your Class 8–12 students. Learn to set boundaries, guide their tools, and ensure your child arrives at college AI-fluent."

Rated 4.4 stars by 300+ Indian parents. DPDP Act 2023 compliant. Free 12-page Parents Guide.

What is AI literacy for children, and why every Indian parent needs to know

AI literacy for your child is the ability to understand, use, evaluate, and question AI responsibly. For a child in Class 8 to 12 in India, it is a foundational capacity, like reading and numeracy.

AI literacy is the ability to understand, use, evaluate, and question AI. For your child in Class 8 to 12, it is not a coding skill. It is a foundational capacity like reading and numeracy: a literacy your child will use for the rest of her working life. The Humain AI Literacy Framework defines what this looks like at each age, across six pillars. Knowing what AI is. Knowing where it fails. Using AI productively without surrendering judgement. Recognising the ethical, social, and emotional stakes. Designing and building with AI. And the capacities AI cannot do for your child: emotional intelligence, metacognition, curiosity and craft. The framework is built on the OECD, UNESCO, and EU AI Literacy frameworks, then rebuilt for India. It aligns with NEP 2020, NCF 2023, and the DPDP Act 2023. You do not need to understand AI yourself. You need to be in the room while your child learns.

Why AI literacy is the new reading and numeracy for Indian children

Four years ago, ChatGPT did not exist. Today your child uses AI in homework helpers, in YouTube recommendations, in the way her school groups her into classes, in the apps she uses for entrance-exam practice. Whether you taught her or not, she is using AI. The question is whether she is using it consciously.

NEP 2020 names digital fluency and computational thinking as foundational. NCF 2023 structures K-12 into four stages and explicitly addresses the role of AI in learning. CBSE introduced Artificial Intelligence as a subject (codes 417 and 843) for Class 9 onwards. ICSE has added AI electives. The Indian school system has accepted that AI literacy belongs in the curriculum. Most Indian parents have not yet been told what that actually means for their child.

At Humain, we wrote this hub for the parent who is asking the right question and getting only marketing in return. Below is the framework, the safety guidance, the data rights you have under the DPDP Act, the five questions every parent should ask, and the answers we give our own children.

Should my child learn AI? A straight answer for parents

Yes. Your child should learn AI, the way she learned to read. AI literacy is now a basic skill, not an optional one. The question is not whether, but how and when.

The honest answer is yes, and it has little to do with whether your child wants to be an engineer. By the time your child finishes Class 12, AI will sit inside almost every job, course, and exam she meets. Learning AI is not about coding. It is about judgement: knowing when to trust an answer, when to question it, and what a machine cannot do for her. A child who starts early carries an advantage a child who waits does not. If you are still deciding whether learning AI is important for your child, start with the free Parents Guide and decide for yourself.

AI future readiness for your child: will AI replace her job, and how to prepare

AI will not replace your child. A person who uses AI well will replace one who cannot. Future readiness is not about predicting which jobs survive. It is about raising a child who can learn, adapt, and work alongside AI.

Parents ask us a version of this every week. Will AI take my child's job? The useful answer is that AI changes jobs faster than it removes them, and the children who do well are the ones who can pick up a new tool, judge its output, and keep the human parts of the work that AI cannot do. Future-proofing a career for your child is less about choosing the perfect degree and more about building the right habits: curiosity, verification, and the confidence to use AI without depending on it. That is what the Humain framework calls future readiness, and it is built into every age band.

The six pillars of AI literacy your child needs to learn, explained for parents

The Humain framework has six pillars. Below is each pillar in one sentence and what it means for your child at home. The full framework is at humainlearning.ai/framework, where you can also download the 32-page reference PDF.

Pillar 1. AI Foundations

Your child learns what AI actually is, how it gets its answers, and why it sometimes invents things with confidence. This is the foundation. A child who understands AI will not mistake confidence for accuracy.

Pillar 2. Ethics, Safety and Responsibility

Your child learns to recognise bias, evaluate misinformation, protect her data under the DPDP Act 2023, and refuse harmful uses of AI. This is the pillar that handles deepfakes in school WhatsApp groups, beauty filters, and AI tools that record everything she types.

Pillar 3. Learning with AI

Your child learns to use NotebookLM, ChatGPT, and Gemini as study partners, not as homework shortcuts. She uses AI to make her CBSE or ICSE practice harder, not easier. She asks better questions, not gets faster answers.

Pillar 4. Creating with AI

Your child learns to make images, videos, voices, and projects with AI tools like Midjourney, Canva AI, and ElevenLabs. Human-first: she writes the brief, makes the creative decisions, and decides what is worth making. AI-second: it is the tool, not the author.

Pillar 5. Agents and Automation

From Class 8 onwards, your child learns to build AI agents and automations. By the end of Humain Champs, she has a personal AI agent that drills her on her syllabus, summarises her textbook chapters, and sends her a study briefing every morning. She keeps it forever.

Pillar 6. Human Intelligence in the Age of AI

Your child learns the three abilities AI cannot do for her. Emotional intelligence. Metacognition. Curiosity and craft. This pillar is the spine of the Humain framework. No other AI literacy programme we have read names this pillar. We think that is a mistake, and we have made it the spine of ours.

Read the full Humain AI Literacy Framework

The five questions every parent should ask about their child and AI

1. Does my child know that AI is a probability machine, not a brain?
2. Does my child verify what AI tells her before she trusts it?
3. Does my child know what to never share with an AI tool?
4. Does my child use AI to think harder, not less?
5. Does my child know which capacities AI cannot do for her?

Each question maps to a pillar. The first three are about basic safety and judgement (Pillars 1 and 2). The fourth is about productive use (Pillar 3). The fifth is the one most parents do not yet think to ask, and it is the one we think matters most (Pillar 6). The full version, with conversation prompts for each, is in the free Parents Guide to AI.

Is AI safe for children in India? AI safety for kids, answered directly

AI can be safe for kids when used with adult supervision and clear guidelines. Younger children (under Class 8) should always use AI with a parent in the room. From Class 8 onwards, with the right framework, children can use AI productively and safely.

The actual answer is conditional. AI is safe for a child when three conditions are met. First, your child knows what AI is and that it can invent facts. Second, your child knows what never to share with an AI tool (real name, school name, address, photos, family information, board enrolment number). Third, you and your child agree on what AI is allowed to do and what it is not. We cover each of these in detail in the free Parents Guide and in the Humain Champs course.

When AI is reasonably safe	When it is not
Child is Class 8 or older and uses it with a parent's knowledge	Child is under Class 8 and uses it alone
Child has been taught to verify before trusting an AI answer	Child accepts the first confident answer as true
Child never pastes personal data into the chat	Child pastes her name, school, photos, or board enrolment
You see what your child is using AI for each week	AI use is private from you, every day
Family has agreed rules about AI for homework	Homework rules with AI have never been discussed

AI safety by age for Indian children: a grade-by-grade guide for parents

Children develop the judgement to handle AI in stages, in the same way they develop the judgement to handle a smartphone or a bicycle. Below is the grade-by-grade guidance Humain teaches in the parent training that accompanies Humain Champs.

Grade band	AI use	Parent role	What to teach first
Class 3 to Class 5	AI used only with a parent in the room	Teach, not supervise from a distance	AI is not a brain; it is a pattern recogniser
Class 6 to Class 8	AI used in shared family space; parent on the side	Co-learn; ask "what did you use AI for this week"	Verification habits; data hygiene
Class 9 to Class 10	AI used independently for study; parent reviews at month-end	Coach; check projects, not chats	Productive use; CBSE/ICSE practice with NotebookLM
Class 11 to Class 12	AI used as a study partner with full independence	Mentor; check outcomes, trust process	Building, citing, and refusing the wrong uses

At Humain, we have implemented this guidance with our own children and across 300-plus families in our Humain Champs cohorts. It is not absolute. Adjust for your child's maturity and the level of support available in your home. The principle is that judgement is built, not granted.

Screen time vs AI learning in India: how to keep your child's AI use balanced

Not all screen time is equal. A child building an AI project is not doing the same thing as a child scrolling a feed. The goal is balanced AI use: short, active, supervised sessions that produce something, not passive hours.

Screen time is the first worry most Indian parents raise, and it is a fair one. But the screen-time conversation misses a distinction that matters. Thirty minutes spent training a model, writing a brief, or checking an AI answer is active and creative. Thirty minutes spent watching auto-played videos is not. Humain keeps AI learning to thirty to forty-five minutes a week for younger children, in shared family spaces, with a clear output at the end. That is the opposite of open-ended scrolling. If AI screen time concerns you, the answer is not zero, it is structure.

AI rules for Indian parents: what to allow and what to push back on

A short, practical list of decisions you will have to make. Each comes from real conversations Humain has had with Indian parents in Delhi NCR, Mumbai, Bengaluru, Pune, and Chennai. None is final. The right answer for your family will depend on your child, your home, and your school.

Allow without much worry	Push back firmly
Using NotebookLM to summarise a chapter, then comparing the summary to the textbook	Using AI to write a board-exam essay and submitting it as her own
Using AI to generate practice questions for board prep	Using AI to answer board questions during a test
Using Canva AI to design a school project poster	Using AI to write the entire project including the research
Using AI to write a first draft and then editing it heavily	Using AI to write the final draft with no editing
Talking to AI about a homework concept she did not understand	Asking AI to do her homework while she does something else
Using Suno to make a song for a school cultural event	Using AI-generated voices to impersonate a teacher or classmate
Sharing family photos with Canva AI to design a birthday card	Sharing family photos publicly through a public AI tool

Print this list and put it on the fridge. The first column is roughly what Pillar 3 (Learning with AI) covers in Humain Champs. The second column is roughly what Pillar 2 (Ethics, Safety and Responsibility) covers.

DPDP Act and AI for kids in India: data rights every Indian parent should know

India's Digital Personal Data Protection Act 2023 gives your child specific protections that did not exist before. We summarise the four that matter most to parents below. None of this is legal

advice. The full text is at meity.gov.in and the Children's Data section of the Humain privacy policy is at [/privacy#children](#).

Parental consent

Any AI service that processes your child's data must have your verifiable consent. This means a click-through tick box on the child's screen is not enough. Many free AI tools do not yet meet this standard for Indian children. Humain meets the standard explicitly: we collect verifiable parental consent before any child account is created.

Purpose limitation

Your child's data may be processed only for the educational purpose stated. If a free AI tool collects her data for "improving the service" without naming what that means, the Act treats that as non-compliant. We name every purpose in our privacy policy.

Right to access and erase

You have the right to access, correct, and erase your child's data. At Humain, you can request a copy of everything we hold on your child by emailing hi@humainlearning.ai. We respond within 30 days under the Act, usually within 5 business days in practice.

Data residency

Your child's data is stored on servers in India. Cross-border transfer is restricted under the Act, and at Humain we do not transfer children's data out of India. If you are using an AI service whose company is registered outside India, ask where the data is stored. Many free AI tools cannot answer this cleanly today.

AI for board exam students in India: how to use AI for Class 10 and Class 12 prep

Used well, AI makes board prep harder, not easier. The right use of AI for a Class 10 or Class 12 board student is to generate tougher practice, mark her answers against the rubric, and find the gaps. Not to write the answers.

Board exams are where the AI question gets serious for Indian parents. The fear is that a child will use AI to shortcut her CBSE or ICSE prep. The opportunity is the opposite. A Class 10 or Class 12 student can use NotebookLM to summarise a chapter and then test herself against it, use AI to generate board-pattern questions a level above her comfort, and ask AI to mark a practice answer against the marking scheme. That is AI for board prep that raises the score instead of faking it. The line is simple: AI may build the practice, your child must do the thinking.

How to teach your child AI at home: a simple method for parents who are new to it

You do not need to know AI to teach your child to use it well. You need a method. Here is the one Humain gives parents who are starting from zero.

1. Sit beside her, not across from her. Use AI together in a shared family space.
2. Start by asking, not telling. Ask what AI she already uses and what she trusts it for.
3. Show her one failure. Let her catch the AI getting a fact wrong, so she learns to verify.
4. Agree three simple rules together. What to never share, when to verify, and what AI is not allowed to do.
5. Have a five-minute check-in. Ask what she used AI for this week, and what she chose not to use it for.

This is how parents can teach AI without being experts. The first conversation is listening. The full method, with a script for each step, is in the free Parents Guide.

AI courses for my child in India: why Class 8 to 12 is the right time to start

Parents ask us directly, so we will answer directly. AI is not a subject for one type of student. Every child in Class 8 to 12 is capable, and every child benefits from starting early, while they are still forming their sense of what they are good at. The risk is not ability, it is being quietly left out: children who are not encouraged into AI early are the ones who arrive at college or work behind. An AI course for your child is one of the simplest ways to close that gap before it opens. Humain Champs runs small, mixed, and interactive batches, where the instructor knows your child by name and her ideas get equal air. Some of our strongest student AI projects have come from students who did not think of themselves as technical at all.

If your child is in Class 8, 9, 10, 11, or 12, the best time to start is now. The free Parents Guide includes a short section on what to look for in any AI course.

The best AI course for my child: what to look for, Class 8 to Class 12

Every parent wants the best AI course for their child, whether she is in Class 8, 9, 10, 11, or 12. Here is a short checklist to judge any course, ours included.

1. Does it teach judgement, not just tools? The best AI program teaches when not to use AI, not only how.
2. Is it live and small-batch? A class your child can speak in beats a recorded video.
3. Does your child build something she keeps? Look for a real project, like a personal AI agent.
4. Is it certified? A recognised certificate, such as one from E-Cell IIT Kharagpur, signals quality.
5. Is your child's data protected? The best AI course is DPDP-compliant and stores data in India.

Humain Champs is built to pass this checklist for Class 8 to Class 12. Compare it against any other AI program for your child using the five points above.

Humain Champs: the AI literacy course for your Class 8 to 12 child

Humain Champs is the live implementation of the Humain AI Literacy Framework for students in Class 8 to Class 12. Fifteen hours of live instruction. Six modules covering all six pillars. Eight sessions. A capstone AI agent your child builds and keeps forever. An E-Cell IIT Kharagpur Hackathon certificate. Small and interactive batches.

An AI agent. A working AI agent personalised to her grade, board (CBSE / ICSE / state), and subjects. She builds it herself and keeps it after the course.

E-Cell IIT Kharagpur certificate. Participation certificate from the entrepreneurship cell of India's oldest IIT.

Fifteen-plus real AI tools. Hands-on use of ChatGPT, Gemini, NotebookLM, Midjourney, Canva AI, Krea, ElevenLabs, Runway, Suno, n8n, and more.

Small and interactive batches. Small enough that the instructor knows your child by name.

Price: Rs. 14,750 for the full course.

Enrol your child in Humain Champs (Rs. 14,750)

Humain Learning AI reviews from Indian parents: rated 4.4 stars by 300-plus families

Five testimonials below, lifted verbatim from parents in our Humain Champs cohorts. Each parent is real and has agreed to be named. We do not edit testimonials, except to fix typing slips.

"The world is moving towards AI, and Aradhya was truly keen to learn. Though I know about AI tools, it was amazing to see her guide me. This course is a great step that we have taken. I deeply appreciate the guidance and thoughtful design made specifically for kids."

Nitin. Parent of Aradhya.

"I am grateful for this well-organised workshop that introduced children to AI. It is encouraging to see platforms like Humain Learning taking the lead in educating the next generation to utilise AI responsibly and safely. The structured modules and creative exercises made the experience meaningful and the discussions on responsible use of AI were insightful. This is a strong and much-needed start for students."

Dr. Tshering. Ayesha's Parent.

"My child is now teaching me about AI! I was amazed by the excitement with which they explained its capabilities. What I really appreciate about Humain Learning trainers is that they did not just focus on the tools, but also on how and how not to use AI. The emphasis on both the positive and negative aspects of relying on AI was very reassuring as a parent."

Mrs. Meenakshi Rao. Bengaluru.

"My child's learning style has changed after this course. She now uses NotebookLM and other AI tools confidently, which are helping her study better. She even built her own study buddy agent during the program."

Mr. Rajesh Malhotra. New Delhi.

"My child created a beautiful family video which we shared in our family group. At the same time, he is also reminding everyone in the family not to share personal photos or videos publicly. It is wonderful to see that he not only learned creative uses of AI but also the importance of safety while using it."

Mrs. Farah Khan. Mumbai.

AI course pricing for Indian parents: free guide and Rs. 14,750 for the flagship

Three tiers for parents. The first is free forever. The second is the Humain Champs course for Class 8 to Class 12 students. The third is for the parent who wants the framework reference document only.

Free

Twelve-page Parents Guide to AI (PDF, English and Hindi). Also free: free baseline assessment for your child and one free lesson from every age band.

AI for kids in India FAQ: 11 questions Indian parents ask, answered

At what age should my child start learning about AI?

The OECD AI Literacy Framework suggests starting at age 8. We start at Class 8, which is the foundational age for structured AI literacy. Below Class 8, the conversation on AI belongs at home, and our free Parents Guide is built to support that. From Class 8 onwards, students can reliably distinguish prediction from fact, train their own classifiers, and build projects that meet CBSE or ICSE practical-exam standards.

~~My child is in Class 4. Is she too young for any of this?~~

~~No. A Class 4 child can have the first conversation with you. She can use the Teachable Machine website with you in the room. She can see that an AI tool sometimes gets things wrong. The Parents Guide includes a one-page activity for parents of Class 3 to Class 5 children. You do not need to enrol her in Humain Champs until Class 8.~~

What if my child uses AI to do her homework?

She will. The question is whether she does it consciously, with your knowledge, and within rules you have agreed. We do not recommend banning AI for homework. We recommend agreeing rules and reviewing them weekly. The section on this page (What to allow, what to push back on) gives a starting list. Print it. Put it on the fridge.

Should I let my child use AI tools like ChatGPT?

Conditional yes. AI tools are safe for a Class 8 or older child who knows what AI is, verifies before trusting, and never pastes personal data into the chat. For younger children, use AI only with you in the room. The AI safety section of this page covers the conditions in detail.

How do I talk to my child about AI?

Start by asking. Not telling. Ask her what AI she uses, where she uses it, and what she trusts it for. The first conversation is listening. The second conversation is the five questions from the parent checklist section of this page. The third conversation is agreeing rules together. The Parents Guide gives you the script for all three.

What if I do not understand AI myself?

That is fine. You do not need to understand AI to teach your child to use it well. You need to be in the room while she learns and ask her good questions now and then. Humain teaches the framework, your child uses the tools. The Parents Guide is written specifically for parents who are coming to AI for the first time. You do not need to be present for every session, but you should be kept in the loop with a quick weekly check-in on what she used AI for and why.

How much screen time does Humain involve?

Fifteen hours total over three to six weeks for Humain Champs (Class 8 to Class 12). Children can do more if they want, but more is not always better at this age, and we have not seen evidence that doubling time doubles learning.

Is my child's data safe with Humain?

Yes. Humain is operated by Eduxa Consulting Pvt Ltd, an Indian company subject to the DPDP Act 2023. Children's data is collected with verifiable parental consent, processed only for the educational purpose stated, stored on servers in India, and deleted on request. The full Children's Data section of the privacy policy is at [/privacy#children](#).

What grades does Humain teach?

The flagship Humain Champs course is for Class 8 to Class 12. The framework on which both are built is the same: the six-pillar Humain AI Literacy Framework.

How is Humain different from a free YouTube AI course for kids?

Free YouTube courses teach instructions. Humain teaches judgement. A YouTube video shows your child how to use an AI tool. Humain teaches her when to use it, when not to, how to verify what it tells her, how to protect her data, and which capacities AI cannot do for her at all.

Humain is also live, in small and interactive batches, and certified by the entrepreneurship cell of IIT Kharagpur. Free YouTube is none of those.

Your child is in Class 8 to 12. This is the right time to prepare her for AI.

Start with the free Parents Guide. Or enrol your child in Humain Champs. Or take the 32-page framework home.
